Common Subsequence

Source: http://acm.tju.edu.cn/toj/showp1683.html

A subsequence of a given sequence is the given sequence with some elements (possible none) left out. Given a sequence $X = \langle x_1, x_2, ..., x_m \rangle$ another sequence $Z = \langle z_1, z_2, ..., z_k \rangle$ is a subsequence of X if there exists a strictly increasing sequence $\langle i_1, i_2, ..., i_k \rangle$ of indices of X such that for all y = 1,2,...,k, y

The program input is from a text file. Each data set in the file contains two strings representing the given sequences. The sequences are separated by any number of white spaces. The input data are correct. For each set of data the program prints on the standard output the length of the maximum-length common subsequence from the beginning of a separate line.
