## Prime Gap

## Source : http://acm.tju.edu.cn/toj/showp3076.html

The sequence of $n-1$ consecutive composite numbers (positive integers that are not prime and not equal to 1 ) lying between two successive prime numbers $p$ and $p+n$ is called a prime gap of length $n$. For example, $\{24,25,26,27,28\}$ between 23 and 29 is a prime gap of length 6.

Your mission is to write a program to calculate, for a given positive integer $k$, the length of the prime gap that contains $k$. For convenience, the length is considered 0 in case no prime gap contains $k$.

## Input

The input is a sequence of lines each of which contains a single positive integer. Each positive integer is greater than 1 and less than or equal to the 100000th prime number, which is 1299709 . The end of the input is indicated by a line containing a single zero.

## Output

The output should be composed of lines each of which contains a single non-negative integer. It is the length of the prime gap that contains the corresponding positive integer in the input if it is a composite number, or 0 otherwise. No other characters should occur in the output.

## Sample Input

10
11
27
2
492170
0

## Sample Output
